

Package ‘zeitgebr’

May 14, 2018

Title Analysis of Circadian Behaviours

Date 2018-05-15

Version 0.3.1

Description Use behavioural variables to compute period, rhythmicity and other circadian parameters.

Depends R (>= 3.00),
behavr

Imports data.table,
lomb,
ggplot2,
pracma

Suggests testthat,
covr,
knitr

License GPL-3

-------	---

dams_sample	<i>A behavr table with approximately ten days of DAM2 recording for 32 fruit flies. The first 10, the following 11 and the last 11 animals have long, short and wild type period, respectively (see meta(dams_sample)). Raw data stored at https://github.com/rethomics/zeitgebr/tree/master/raw_data</i>
-------------	--

Description

A behavr table with approximately ten days of DAM2 recording for 32 fruit flies. The first 10, the following 11 and the last 11 animals have long, short and wild type period, respectively (see meta(dams_sample)). Raw data stored at https://github.com/rethomics/zeitgebr/tree/master/raw_data

Usage

```
dams_sample
```

Format

An object of class behavr (inherits from data.table, data.frame) with 415040 rows and 3 columns.

Author(s)

Luis Garcia

find_peaks	<i>Find peaks in a periodogram</i>
------------	------------------------------------

Description

This function locates the peaks in a pregenerated periodogram. Detection is based on [pracma::findpeaks](#). Only the significant (with threshold ‘alpha’) peaks are extracted.

Usage

```
find_peaks(data, n_peaks = 3)
```

Arguments

data	behavr::behavr table representing a periodogram, as returned by periodogram
n_peaks	maximal numbers of peak to be detected

Value

`behavr::behavr` table that is data with an extra column `peak`. `peak` is filled with zeros except for rows match a peak. In which case, rows have an integer value corresponding to the rank of the peak (e.g. 1 for the first peak).

References

See Also

- [periodogram](#) – to generate a periodogram in a first place

Examples

```
data(dams_sample)
per_dt_xs <- periodogram(activity, dams_sample, FUN = chi_sq_periodogram)
per_dt_xs_with_peaks <- find_peaks(per_dt_xs)
per_dt_xs_with_peaks[peak == 1]
```

periodogram	<i>Computes periodograms</i>
-------------	------------------------------

Description

This function builds periodograms, with one of several methods, for each individual of a `behavr` table

Usage

```
periodogram(var, data, period_range = c(hours(16), hours(32)),
  resample_rate = 1/mins(15), alpha = 0.01, FUN = chi_sq_periodogram, ...)
```

Arguments

<code>var</code>	variable to analyse
<code>data</code>	<code>behavr</code> table
<code>period_range</code>	vector of size 2 defining minimal and maximal range of period to study (in seconds)
<code>resample_rate</code>	frequency to resample (up or down) the data at (in hertz)
<code>alpha</code>	significance level
<code>FUN</code>	function used to compute periodogram (see periodogram_methods)
<code>...</code>	additional arguments to be passed to <code>FUN</code>

Value

A `beavr::beavr` table. In addition to the metadata, it contains data that encodes a periodogram (i.e. power vs period). The data contains the columns:

- `power` – the power the or equivalent (according to FUN)
- `period` – the period at which power is computed (in seconds)
- `p_value` – the p value associated to the power estimation
- `signif_threshold` – the threshold above which power is considered significant

References

See Also

- [periodogram_methods](#) – the list of built-in methods
- [find_peaks](#) – to find peaks in the periodogram

Examples

```
data(dams_sample)
pdt <- periodogram(activity, dams_sample, FUN = ls_periodogram, oversampling = 4)
pdt <- periodogram(activity, dams_sample, FUN = chi_sq_periodogram)
```

periodogram_methods *Methods For Computing Periodograms*

Description

These functions provides a series of methods to assess periodicity of circadian processes.

Usage

```
ac_periodogram(x, period_range = c(hours(16), hours(32)),
  sampling_rate = 1/mins(1), alpha = 0.05)

chi_sq_periodogram(x, period_range = c(hours(16), hours(32)),
  sampling_rate = 1/mins(1), alpha = 0.05, time_resolution = hours(0.1))

fourier_periodogram(x, period_range = c(hours(16), hours(32)),
  sampling_rate = 1/mins(1), alpha = 0.05)

ls_periodogram(x, period_range = c(hours(16), hours(32)),
  sampling_rate = 1/mins(1), alpha = 0.05, oversampling = 8)
```

Arguments

x	numeric vector
period_range	vector of size 2 defining minimal and maximal range of period to study (in seconds)
sampling_rate	the – implicitly regular – sampling rate of x (in hertz)
alpha	significance level
time_resolution	the resolution of periods to scan
oversampling	the oversampling factor (see lomb::lsp)

Value

a [data.table](#) with the columns:

- period – the period (in s)
- power – the power (or equivalent) for a given period
- p_value – the significance of the power
- signif_threshold – the significance threshold of the power (at alpha)
